With the AixBOMS IX (9.0.1.5) software release, AixpertSoft GmbH introduced a new benchmark for CMDB system environments. Recent analysis shows that classical CMDBs are frequently unable to cope with typical business and planning tasks in the areas of Business Service Management (BSM), Data Center Management and Green IT, and Operational Management. But over time, AixpertSoft has consistently implemented its strategic vision and today can present a software generation that is second to none and fully meets the above-mentioned requirements.

The main new features of AixBOMS IX include:

- Platform independence through Eclipse IDE and Java technology, Open Source Integration and homogeneous software architecture;
- The standard user interface "AixBOMS Navigator" for all applications;
- New Java forms technology that meets current ergonomic requirements;
- New dashboard technology based on BIRT;
- The AixBOMS Navigator, an integrated graphic design tool for WAN, site, building, floor and data-center layout;
- The Integration Navigator for reconciliation, quality assurance and load processes;
- An expansion of the wizard framework and general functionality and features.
