Computer Associates (CA) Workload Automation simplifies and dynamically automates complex workloads for enterprise IT applications deployed across physical, virtual or cloud environments. It leads to lower capital expenditures and more consistent results by simplifying efforts, increasing efficiency and better aligning workloads with business priorities.

CA Workload Automation aims to provide business agility, service quality and control, as well as reduce risk and human error, minimize costs, and improve IT efficiency – all by providing advanced automation capabilities to better manage all scheduled and business event-based workloads across the infrastructure in an easy-to-use tool for both IT operations and application developers. With fewer and reusable workload definitions, customers can:

- Reduce maintenance efforts and IT costs;
- Improve the visibility, accessibility and manageability of workload processes;
- Deliver faster turnaround on requested business.

In October 2009, CA announced that the desktop client of CA Workload Automation (Release 11.1) now integrates with BIRT, which runs reports directly from the desktop client interface. Canned reports are included, as well as a report design tool to create customized reports. BIRT also provides the ability to export reports to different formats such as CSV, Word, PDF, PostScript and Excel.
