[www.espertech.com](http://www.espertech.com)

The architecture and capabilities of EsperTech's EsperJDBC allow users to perform on-demand queries on continuous results handled by Esper. Users can configure and design a visually friendly report with tables and charts, with data coming out of the EsperJDBC-enabled server – all without code.

BIRT is used to create reports within EsperJDBC. For example, BIRT can be used to create a report to display key metrics computed continuously by the Esper CEP server. Data can also now be bound from the Esper server to a BIRT report through drag-and-drop functionality. A BIRT report can be deployed to a BIRT Server so that everyone can access it and get a direct view on the continuous event processing that occurs in the Esper CEP Server.
